Project Folder Structure

Created the Database class to establish a PDO connection between the PHP application and MySQL database.

```php
<?php

class Database {

    private $host = 'localhost';
    private $db_name = 'inventory_db';
    private $username = 'root';
    private $password = '';

    public function connect() {

        $conn = null;

        try {

            $conn = new PDO(
                'mysql:host=' . $this->host . ';dbname=' . $this
                $this->username,
                $this->password
            );

            $conn->setAttribute(
                PDO::ATTR_ERRMODE,
                PDO::ERRMODE_EXCEPTION
            );

        } catch (PDOException $e) {

            echo 'Connection Error: ' . $e->getMessage();

        }

        return $conn;
    }
}
```

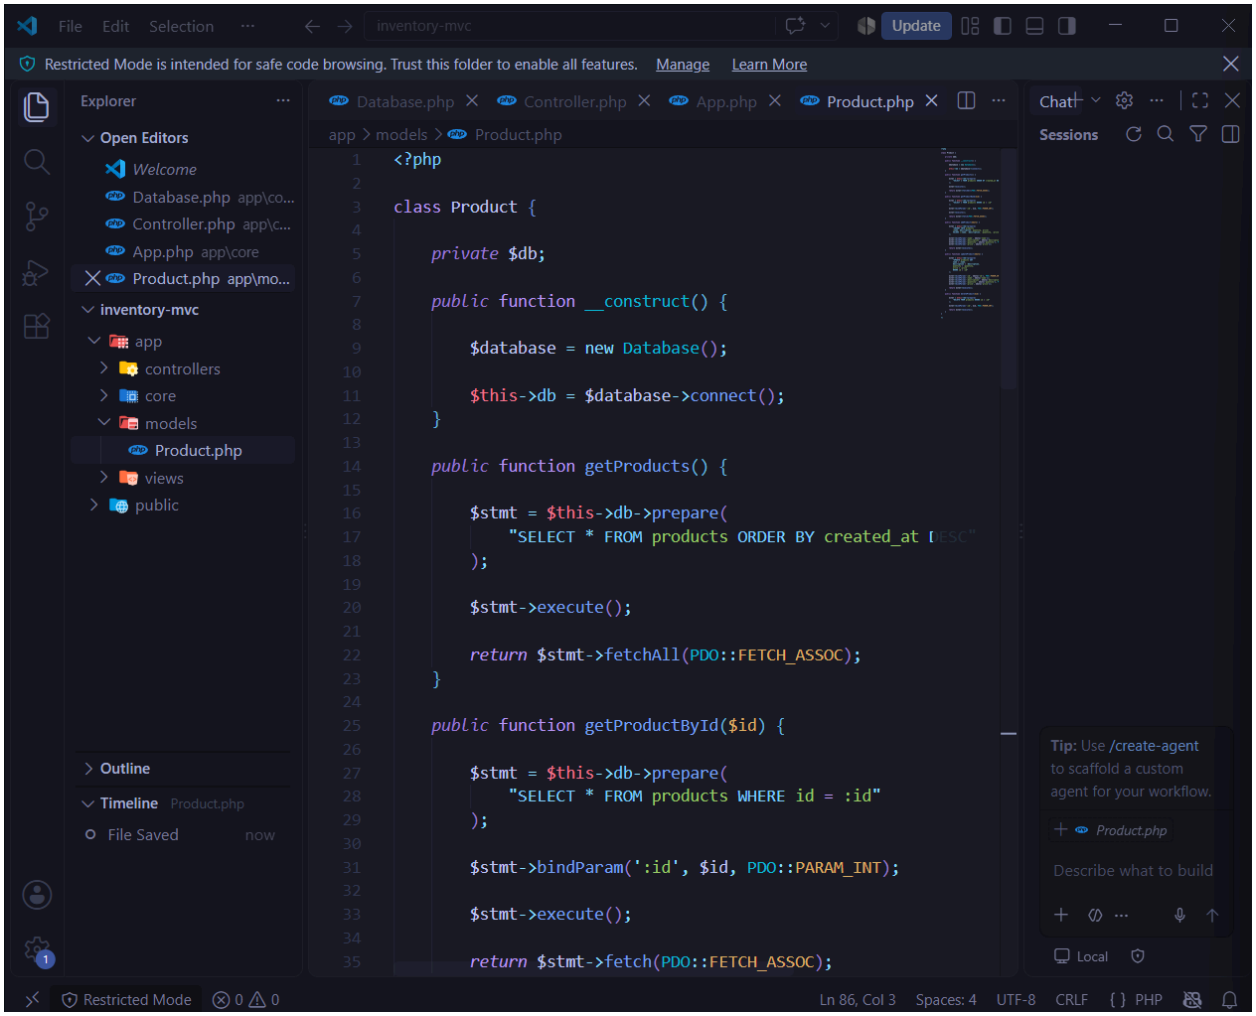

Created the base Controller class for loading models and views.

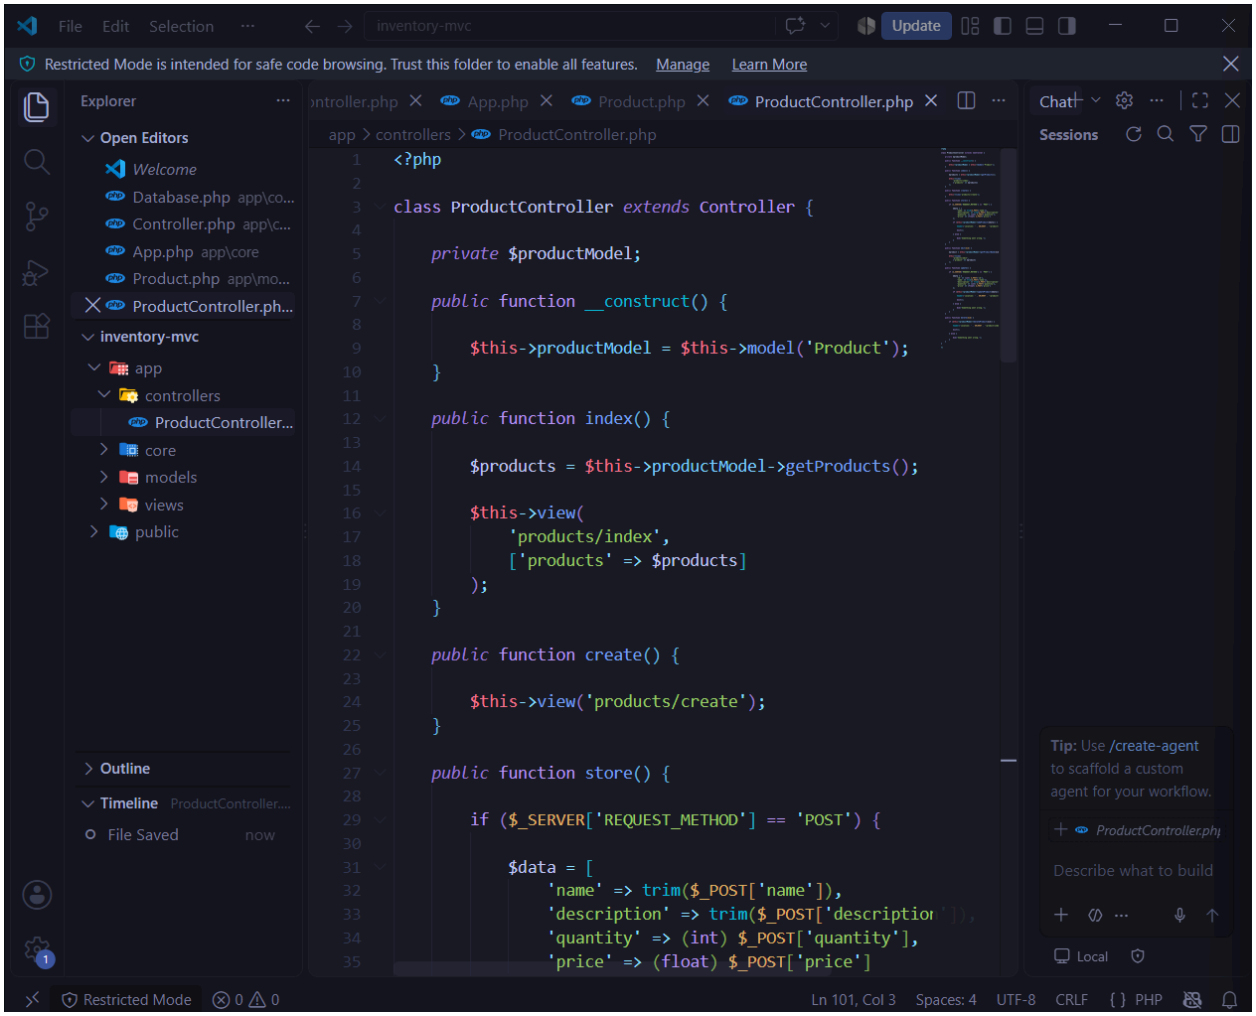

Created the App router to handle URLs and direct requests to the appropriate controller and method.

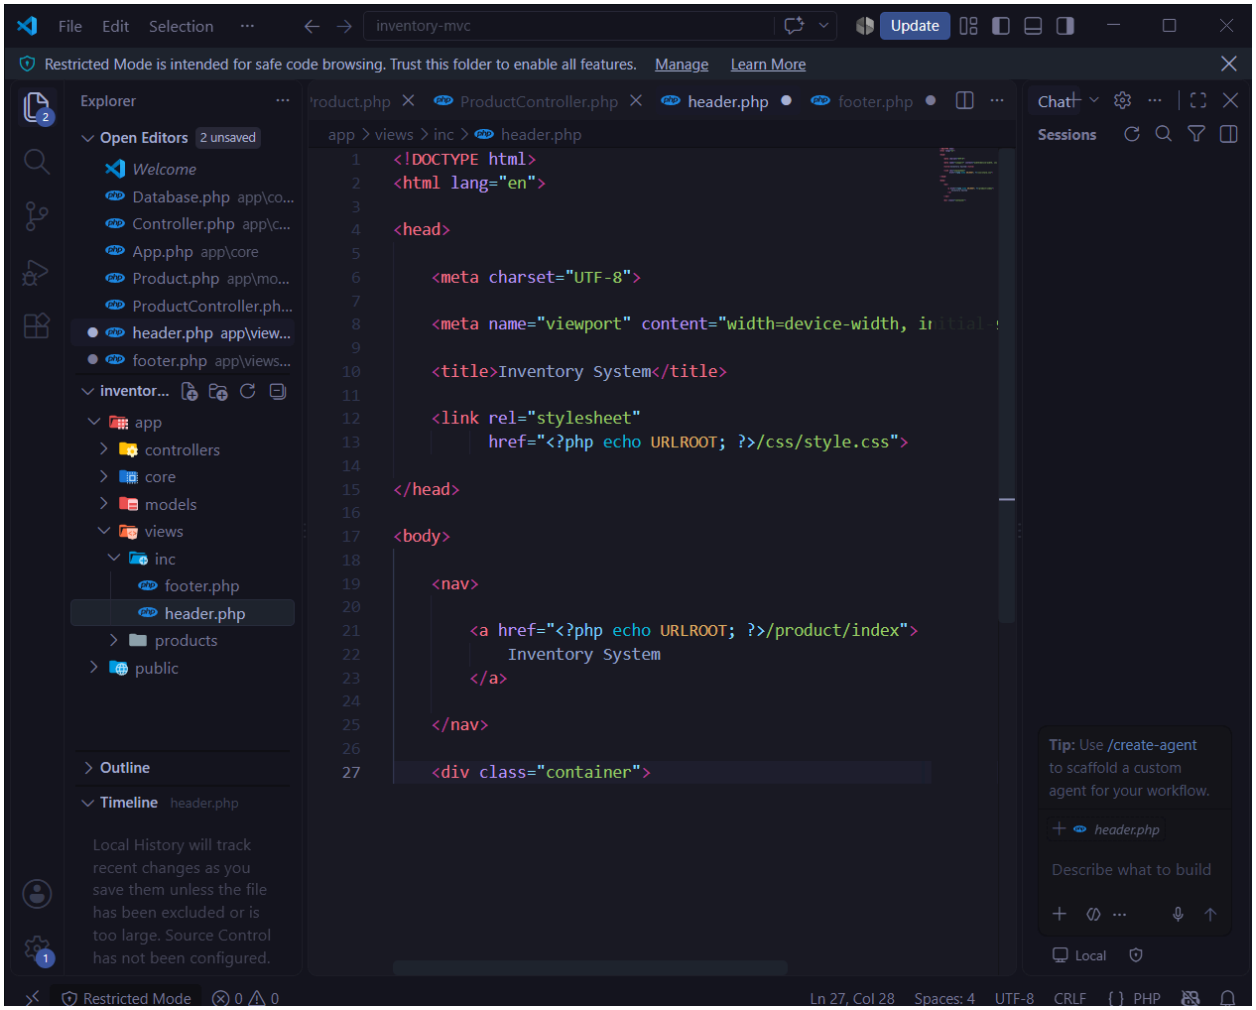

Created the Product Model to handle CRUD database operations using PDO prepared statements.

Created the Product Controller to process requests and connect the Product Model with the application views.

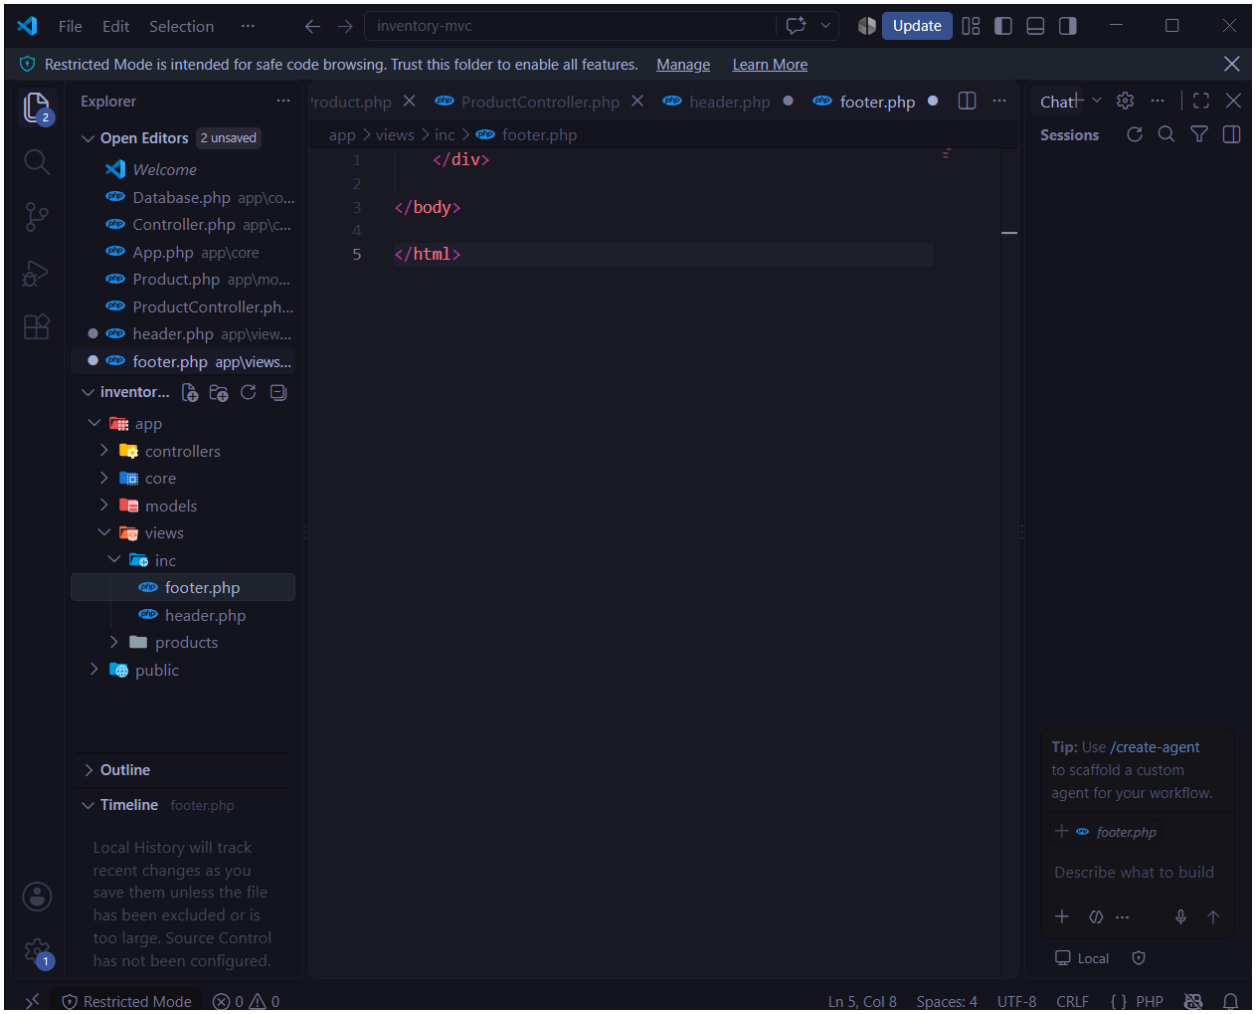

Created the header and footer files used as reusable components for the application views.
