Conclusion:

Transaction Manager effectively showcases the development of a complete-stack CRUD web application using React, Node.js/Express, and MongoDB. The web app features all important transaction management operations, such as adding, viewing, editing, and removing financial transactions along with search and filter functionalities. Input validation, error handling, currency formatting, and responsiveness are also included.

Using this application, it is possible to see the process of communication between the frontend and backend REST API for transactions management. Thus, it can be said that the goals of the activity have been achieved in this project.
